

Delivery information

Active cultures of this strain are liable to lose viability over transportation. Then, we send diluted cultures to users on a regular basis. On receiving, user should incubate it at 80-85C for 1-2 days as soon as possible, or store it in a refrigerator until use (the diluted culture may be resuscitable for 2 to 3 weeks at 4-8 C). Growth should be checked under a microscope. To maintain a viable culture, we recommend preserving it by freezing at -80C or below in the growth medium containing 5% DMSO (final) at an early occasion.
